Re: New regulations concerning the Bathurst Caribou herd harvest management.

Following a review of the Nunavut Wildlife Management Board's decision, consultation with partners, and recognizing the current status of the Bathurst Caribou herd, the Government of Nunavut has established a TAH of thirty (30) male only caribou for the Bathurst caribou herd. The Government also supports the various initiatives aimed at the development of the Bathurst Caribou Management Plan.

The total allowable harvest (TAH) for the Bathurst caribou herd will be effective as of July 1, 2017. The Kitikmeot Regional Wildlife Board will allocate this TAH among the affected Hunters and Trappers Organizations and advise the Department of Environment of their decision on or before June 15, 2017. This will facilitate the distribution of the appropriate number of tags to each HTO having a share of the Bathurst Caribou TAH.

My Department's regional staff and local Conservation Officers will work with co-management partners, particularly the Burnside Hunters and Trappers Association and the Kugluktuk Angoniatit

1

「ぴつく つぐへ こんぱん しょう Minister of Environment Ministaat Avatiliqiyitkut Ministre de l'Environnement

Association, to prepare for the implementation and management of this TAH. This will include: the management of the tags, the harvest reporting system, and sample collection.

My staff will also be available to provide technical and field support for the development of any necessary Regional Wildlife Organization (RWO) or HTO rules related to the management of tags and non-quota limitations such as harvest area restrictions and seasonal harvest restrictions that the RWO or HTOs may want to put in place.

Further, my Department will be happy to assist HTOs to finalize their Integrated Community Caribou Management Plan (ICCMP) for the conservation of the Bathurst caribou herd. It would be useful to have this ICCMP finalized by Fall 2017 to align with the territorial and inter-jurisdictional initiatives related to the management of this herd.

On-going communication, meetings, and the recent NWMB public hearing have shown that we all share concerns regarding the declining rate of the Bathurst Caribou herd. I hope that our collaborative work will continue in implementing this TAH and other management actions needed to foster the recovery of this caribou herd.

Best Regards,

Joe Savikataaq

Dear Co-Management Partners,

Re: Status of the Integrated Community Caribou Management Plan (ICCMP) for the Bathurst Caribou in the Kitikmeot Region

The sustainability of Bathurst caribou in Nunavut assures caribou harvest by Inuit for future generations — and this is a shared goal among co-management partners in Nunavut. Following the Nunavut Wildlife Management Board's decision to establish a Total Allowable Harvest of 30 male only caribou for the 2017 harvest year (see Minister Savikataaq's letter attached), the Board identified a community-based management plan, the "Integrated Community Caribou Management Plan (ICCMP)" for the Bathurst Caribou in the Kitikmeot Region to be finalized by Fall 2017, in order to align with other territorial and inter-jurisdictional initiatives related to the management of this herd.

P.O. Box 377, Enokhok Building Kugluktuk, Nunavut X0B 0E0 1(867) 982-7440 #(867) 982-3701 www.gov.nu.ca

حېرتبکانځ Department of Environment Avatiliqlyikkut Ministère de l'Environnement

To this end, the Government of Nunavut, Department of Environment, would like to offer our technical support and resource staff to assist the Hunters and Trappers Organizations and the Kitikmeot Regional Wildlife Board in further developing this community-based management plan - in whatever ways that may be of assistance.

Our Department is looking forward to working together with you on this community-based comanagement initiative that will help foster the re-vitalization and sustainability of Bathurst Caribou.

Please feel free to contact me for any further technical assistance and support on these communitybased management initiatives. I can be reached at 867-982-7444 at any time, or LLeclerc@gov.nu.ca.

Regards,

COSEPAC Comité sur la situation des espèces en péril au Canada

Caribou, Monarch butterflies: Canada's iconic migrants at grave risk

OTTAWA, ONTARIO (December 5, 2016). From Coho Salmon to Caribou to the muchcherished Monarch butterfly, migration is a key component of Canadian biodiversity. Migratory species, migration and movement all figured prominently at the semi-annual Committee on the Status of Endangered Wildlife in Canada (COSEWIC) deliberations on species at risk, held November 27 - December 2nd.

Young Coho Salmon from the Interior Fraser River basin leave the watershed and live much of their adult lives at sea before migrating back to their native rivers to lay eggs. The Committee considered threats in both fresh and salt water, and the wildlife species' status was assessed as having improved from Endangered to Threatened. Despite ongoing active management and some improvements, the situation faced by Interior Fraser River Coho Salmon is still perilous.

Caribou, Barren-ground population @ Ann Gunn

Another iconic migratory species considered by COSEWIC was Caribou, Several populations migrate hundreds of kilometres en masse between their calving and wintering grounds every year. Caribou have experienced alarming declines. Both science and Aboriginal Traditional

Knowledge indicate

unprecedented declines in several herds with some human activities on the landscape being novel, potentially disrupting natural cycles. According to Justina Ray, co-chair of the Terrestrial Mammals Subcommittee, "Caribou are, sadly, very sensitive to human disturbances, and we are disturbing Caribou more and more. These stressors seem to be interacting in complicated ways with rapid warming in the North. Many of the great northern Caribou herds have now fallen to all-time lows, and there is cause for concern that they will not rebound in the same way they have before." COSEWIC considered the status of two such populations for the first time. Both were found to be in trouble: The Caribou Barren-ground population was assessed as Threatened, while the much rarer Torngat Mountain population in far northeastern Canada was assessed at even higher risk - Endangered.

A third migratory species considered by COSEWIC was the Monarch butterfly. These insects fly over 4,000 kilometres south to Mexico in the fall to overwinter. They breed on their return trip, and their great-grandchildren arrive back in Canada in spring. However, the remarkably tiny wintering grounds where Monarchs congregate continue to be chipped away by habitat loss. Monarch butterfly migration is now recognized as a "threatened process" by the International Union for the Conservation of Nature (IUCN). Indeed, it is the only natural process with this

unfortunate distinction. COSEWIC assessed the species as Endangered. Jennifer Heron, co-chair of the Arthropods Subcommittee, summed it up: "We need to continue to support the conservation of milkweed caterpillar habitat both here in Canada and along the Monarch's migratory journey, and we need to support continued conservation of critical overwintering areas. Otherwise, Monarch migration may disappear, and Canada may lose this iconic species."

Monarch @ Jessica Linton

The Pink-footed Shearwater finds itself in a comparable situation. Breeding on only three small islands off the coast of Chile, many of these birds travel thousands of kilometres north to feed along the coast of British Columbia during our summer months. The species' southern home is under multiple threats from humans and exotic predators, and shearwaters are killed as fishing by-catch throughout its range. This rare bird was re-assessed as Endangered.

Human interference also causes problems for animal movements at smaller, local scales. Dams that stop Westslope Cutthroat Trout from moving between spawning and feeding grounds have contributed to their shrinking distribution in Alberta. This fish's Saskatchewan – Nelson Rivers populations were re-assessed as Threatened. Slow-moving Blanding's Turtles, which can live for 80 years, travel up to three kilometres from nesting beaches and other summer habitats to fewer small freshwater pools where they overwinter, year after year. Vehicles increasingly threaten this rare turtle wherever roads cross the turtles' seasonal routes, and this species was assessed as Endangered in both Nova Scotia and in central Canada.

In contrast to most of the species assessed by COSEWIC, the widely distributed Blue Shark was assessed as Not At Risk in Canada, in part due to ongoing successful management. New satellite tracking data for this renowned long-distance migrant confirmed long-range movements and seasonal migrations between inshore and deeper offshore habitats.

But of the species assessed, Blue Shark was the exception. Many migratory species decline in step with human barriers and habitat changes. The Chair of COSEWIC, Eric Taylor, stated the bottom line: "Disruptions to migratory behavior are associated with the threat of extinction for species all over the world. We will need to continue to change how we use our landscape so that we and wildlife can thrive together. COSEWIC's work assessing Canadian wildlife helps us do that "

Next meeting

COSEWIC's next scheduled wildlife species assessment meeting will be held in April 2017.

About COSEWIC

COSEWIC assesses the status of wild species, subspecies, varieties, or other important units of biological diversity, considered to be at risk in Canada. To do so, COSEWIC uses scientific, Aboriginal traditional and community knowledge provided by experts from governments, academia and other organizations. Summaries of assessments are currently available to the public on the COSEWIC website (www.cosewic.gc.ca) and will be submitted to the Federal Minister of the Environment and Climate Change in fall 2017 for listing consideration under the Species at Risk Act (SARA). At this time, the status reports and status appraisal summaries will be publicly available on the Species at Risk Public Registry (www.sararegistry.gc.ca).

At its most recent meeting, COSEWIC assessed 40 wildlife species in various COSEWIC risk categories, including 13 Endangered, 6 Threatened, and 11 Special Concern. In addition to these wildlife species that are in COSEWIC risk categories, COSEWIC assessed 6 wildlife species as Not at Risk. An additional 4 were found to be Data Deficient.

COSEWIC comprises members from each provincial and territorial government wildlife agency, four federal entities (Canadian Wildlife Service, Parks Canada Agency, Fisheries and Oceans Canada, and the Canadian Museum of Nature), three Non-government Science Members, and the Co-chairs of the Species Specialist and the Aboriginal Traditional Knowledge Subcommittees.

Definition of COSEWIC terms and status categories:

Wildlife Species: A species, subspecies, variety, or geographically or genetically distinct population of animal, plant or other organism, other than a bacterium or virus, that is wild by nature and is either native to Canada or has extended its range into Canada without human intervention and has been present in Canada for at least 50 years.

Extinct (X): A wildlife species that no longer exists.

Extirpated (XT): A wildlife species that no longer exists in the wild in Canada, but exists elsewhere.

Endangered (E): A wildlife species facing imminent extirpation or extinction.

Threatened (T): A wildlife species that is likely to become Endangered if nothing is done to reverse the factors leading to its extirpation or extinction.

Special Concern (SC): A wildlife species that may become Threatened or Endangered because of a combination of biological characteristics and identified threats.

Not at Risk (NAR): A wildlife species that has been evaluated and found to be not at risk of extinction given the current circumstances.

Data Deficient (DD): A category that applies when the available information is insufficient (a) to resolve a wildlife species' eligibility for assessment or (b) to permit an assessment of the wildlife species' risk of extinction.

Species at Risk: A wildlife species that has been assessed as Extirpated, Endangered, Threatened or Special Concern.
